

5V 1M×16 CMOS DRAM (fast-page mode)

Features

- Organization: 1,048,576 words × 16 bits
- High speed
  - 45/50/60 ns  $\overline{\text{RAS}}$  access time
  - 20/20/25 ns fast page cycle time
  - 10/12/15 ns  $\overline{\text{CAS}}$  access time
- Low power consumption
  - Active: 880 mW max (AS4C1M16F5-60)
  - Standby: 11 mW max, CMOS DQ
- Fast page mode
- 1024 refresh cycles, 16 ms refresh interval
  - $\overline{\text{RAS}}$ -only or  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh
- Read-modify-write
- TTL-compatible, three-state DQ
- JEDEC standard package and pinout
  - 400 mil, 42-pin SOJ
  - 400 mil, 44/50-pin TSOP 2
- 5V power supply
- Industrial and commercial temperature available

## Functional description

The AS4C1M16F5 is a high performance 16-megabit CMOS Dynamic Random Access Memory (DRAM) organized as 1,048,576 words  $\times$  16 bits. The AS4C1M16F5 is fabricated using advanced CMOS technology and innovative design techniques resulting in high speed, extremely low-power and wide operating margins at component and system levels. The Alliance 16Mb DRAM family is optimized for use as main memory in personal and portable PCs, workstations, and multimedia and router switch applications.

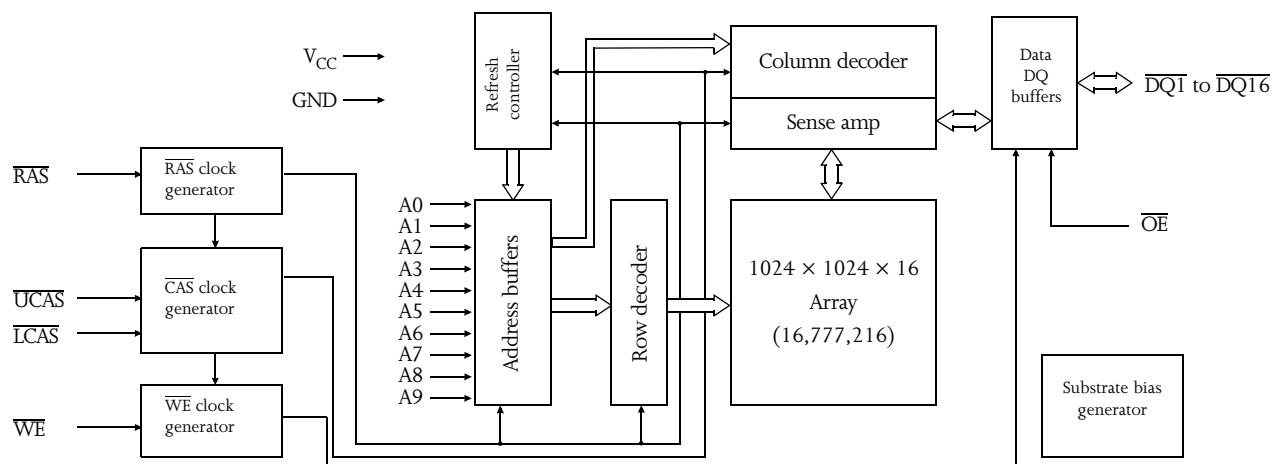

The AS4C1M16F5 features high speed page mode operation where read and write operations within a single row (or page) can be executed at very high speed (15 ns from  $\overline{\text{XCAS}}$ ) by toggling column addresses within that row. Row and column addresses are alternately latched into input buffers using the falling edge of  $\overline{\text{RAS}}$  and  $\overline{\text{xCAS}}$  inputs respectively. Also,  $\overline{\text{RAS}}$  is used to make the column address latch transparent, enabling application of column addresses prior to  $\overline{\text{xCAS}}$  assertion. The AS4C1M16F5 provides dual  $\overline{\text{UCAS}}$  and  $\overline{\text{LCAS}}$  for independent byte control of read and write access.

Refresh on the 1024 address combinations of A0 to A9 must be performed every 16 ms using:

- $\overline{\text{RAS}}$ -only refresh:  $\overline{\text{RAS}}$  is asserted while  $\overline{\text{xCAS}}$  is held high. Each of the 1024 rows must be strobed. Outputs remain high impedance.
- Hidden refresh:  $\overline{\text{xCAS}}$  is held low while  $\overline{\text{RAS}}$  is toggled. Outputs remain low impedance with previous valid data.
- $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh (CBR): At least one  $\overline{\text{xCAS}}$  is asserted prior to  $\overline{\text{RAS}}$ . Refresh address is generated internally. Outputs are high-impedance ( $\overline{\text{OE}}$  and  $\overline{\text{WE}}$  are don't care).
- Normal read or write cycles refresh the row being accessed.

The AS4C1M16F5 is available in the standard 42-pin plastic SOJ and the 44/50-pin TSOP 2 packages, respectively. It operates with a single power supply of  $5\text{V} \pm 0.5\text{V}$ . The device provides TTL compatible inputs and outputs.

## Notes

- $I_{CC1}$ ,  $I_{CC3}$ , and  $I_{CC4}$  are dependent on frequency.
- $I_{CC1}$  and  $I_{CC4}$  depend on output loading. Specified values are obtained with the output open.
- An initial pause of 200  $\mu$ s is required after power-up followed by any 8  $\overline{\text{RAS}}$  cycles before proper device operation is achieved. In the case of an internal refresh counter, a minimum of 8  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  initialization cycles instead of 8  $\overline{\text{RAS}}$  cycles are required. 8 initialization cycles are required after extended periods of bias without clocks (greater than 8 ms).
- AC Characteristics assume  $t_T = 2$  ns. All AC parameters are measured with a load equivalent to two TTL loads and 100 pF,  $V_{IL}(\text{min}) \geq \text{GND}$  and  $V_{IH}(\text{max}) \leq V_{CC}$ .
- $V_{IH}(\text{min})$  and  $V_{IL}(\text{max})$  are reference levels for measuring timing of input signals. Transition times are measured between  $V_{IH}$  and  $V_{IL}$ .
- Operation within the  $t_{\text{RCD}}(\text{max})$  limit insures that  $t_{\text{RAC}}(\text{max})$  can be met.  $t_{\text{RCD}}(\text{max})$  is specified as a reference point only. If  $t_{\text{RCD}}$  is greater than the specified  $t_{\text{RCD}}(\text{max})$  limit, then access time is controlled exclusively by  $t_{\text{CAC}}$ .
- Operation within the  $t_{\text{RAD}}(\text{max})$  limit insures that  $t_{\text{RAC}}(\text{max})$  can be met.  $t_{\text{RAD}}(\text{max})$  is specified as a reference point only. If  $t_{\text{RAD}}$  is greater than the specified  $t_{\text{RAD}}(\text{max})$  limit, then access time is controlled exclusively by  $t_{\text{AA}}$ .
- Assumes three state test load (5 pF and a 380  $\Omega$  Thevenin equivalent).
- Either  $t_{\text{RCH}}$  or  $t_{\text{RRH}}$  must be satisfied for a read cycle.
- $t_{\text{OFF}}(\text{max})$  defines the time at which the output achieves the open circuit condition; it is not referenced to output voltage levels.  $t_{\text{OFF}}$  is referenced from rising edge of  $\overline{\text{RAS}}$  or  $\overline{\text{CAS}}$ , whichever occurs last.
- $t_{\text{WCS}}$ ,  $t_{\text{WCH}}$ ,  $t_{\text{RWD}}$ ,  $t_{\text{CWD}}$  and  $t_{\text{AWD}}$  are not restrictive operating parameters. They are included in the datasheet as electrical characteristics only. If  $t_{\text{WS}} \geq t_{\text{WS}}(\text{min})$  and  $t_{\text{WH}} \geq t_{\text{WH}}(\text{min})$ , the cycle is an early write cycle and data out pins will remain open circuit, high impedance, throughout the cycle. If  $t_{\text{RWD}} \geq t_{\text{RWD}}(\text{min})$ ,  $t_{\text{CWD}} \geq t_{\text{CWD}}(\text{min})$  and  $t_{\text{AWD}} \geq t_{\text{AWD}}(\text{min})$ , the cycle is a read-write cycle and the data out will contain data read from the selected cell. If neither of the above conditions is satisfied, the condition of the data out at access time is indeterminate.
- These parameters are referenced to  $\overline{\text{CAS}}$  leading edge in early write cycles and to  $\overline{\text{WE}}$  leading edge in read-write cycles.
- Access time is determined by the longest of  $t_{\text{CAA}}$  or  $t_{\text{CAC}}$  or  $t_{\text{CPA}}$ .
- $t_{\text{ASC}} \geq t_{\text{CP}}$  to achieve  $t_{\text{PC}}(\text{min})$  and  $t_{\text{CPA}}(\text{max})$  values.
- These parameters are sampled and not 100% tested.
- These characteristics apply to AS4C1M16F5 5V devices.

## AC test conditions

- Access times are measured with output reference levels of  $V_{\text{OH}} = 2.4\text{V}$  and  $V_{\text{OL}} = 0.4\text{V}$ ,  $V_{\text{IH}} = 2.4\text{V}$  and  $V_{\text{IL}} = 0.8\text{V}$
- Input rise and fall times: 2 ns
