Description

The HSSR-8200 consists of a high-voltage integrated circuit optically coupled with a light emitting diode. This device is a solid-state replacement for single-pole, normally-open electromechanical relays used for general purpose switching of analog signals.

The light-emitting diode controls the ON/OFF function of the solid-state relay. The detector contains high voltage MOS transistors and a high speed photosensitive drive circuit. This relay has superior OFF impedance, very low output offset voltage and input drive current.

CAUTION: It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

The electrical and switching characteristics of the HSSR-8200 are specified from -40°C to $+85^{\circ}\text{C}$. The low I_F allows compatibility with TTL, LSTTL, and CMOS logic resulting in low power consumption compared to other solid state and mechanical relays.

as reference. $V_{\text{O(ON)}}$ must be measured in a stable ambient. See Figure 8 for variation of $V_{\text{O(ON)}}$ around the typical value.

- Device considered a two terminal device: pins 1 and 4 shorted together, and pins 5 and 8 shorted together.

- This is a momentary withstand proof test. These parts are 100% tested in production at 3000 Vrms, one second.
- $R_{\text{(OFF)}}$ is defined as $V_{\text{O(OFF)}}/I_{\text{O(OFF)}}$.

- R1 - REQUIRED CURRENT-LIMITING RESISTOR FOR $I_{\text{F(ON)}} = 1 \text{ mA}$
R2 - PULL-UP RESISTOR FOR $V_{\text{F(OFF)}} < 600 \text{ mV}$; IF $(V_{\text{CC}} - V_{\text{OH}}) < 600 \text{ mV}$, OMIT R2
