

## TPS6226x 2.25-MHz 600-mA Step Down Converter in 2 x 2 WSON and SOT Package

### 1 Features

- High Efficiency Step-Down Converter
- Output Current up to 600 mA
- $V_{IN}$  Range from 2 V to 6 V for Li-ion Batteries with Extended Voltage Range
- 2.25-MHz Fixed Frequency Operation
- Power Save Mode at Light Load Currents
- Output Voltage Accuracy in PWM Mode  $\pm 1.5\%$
- Typical 15- $\mu$ A Quiescent Current
- 100% Duty Cycle for Lowest Dropout
- Voltage Positioning at Light Loads
- Available in a SOT (5) and 2-mm x 2-mm x 0.8-mm WSON (6) Package
- Allows <1-mm Solution Height

### 2 Applications

- Mobile Phones, Smart Phones
- Low Power DSP Supply
- Portable Media Players
- Point-of-Load (POL) Applications

### 3 Description

The TPS6226x device is a highly efficient synchronous step-down DC/DC converter. The TPS6226x provides up to 600-mA output current from a single Li-Ion cell, and is ideal for battery-powered applications such as mobile phones and other portable equipment.

With an wide input voltage range of 2 V to 6 V, the device also supports two- and three-cell alkaline batteries, 3.3-V and 5-V input voltage rails.

The TPS6226x operates at 2.25-MHz fixed-switching frequency, and enters power save mode operation at light load currents to maintain high efficiency over the entire load current range.

The power save mode is optimized for low-output voltage ripple. For low noise applications, the device can be forced into fixed frequency pulse-width modulation (PWM) mode by pulling the MODE pin high. In the shutdown mode, the current consumption is reduced to less than 1  $\mu$ A. The TPS6226x allows the use of small inductors and capacitors to achieve a small solution size.

The TPS6226x operates over a free air temperature range of  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ . It is available in a 5-pin SOT and a 6-pin 2-mm x 2-mm WSON package.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS62260	WSON (6)	2.00 mm x 2.00 mm
	SOT (5)	2.90 mm x 1.60 mm
TPS62261	WSON (6)	2.00 mm x 2.00 mm
TPS62262	WSON (6)	2.00 mm x 2.00 mm
	SOT (5)	2.90 mm x 1.60 mm
TPS62263	WSON (6)	2.00 mm x 2.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

### Pin Functions

NAME	PIN		I/O	DESCRIPTION
	WSON	SOT		
EN	4	3	IN	This is the enable pin of the device. Pulling this pin to low forces the device into shutdown mode. Pulling this pin to high enables the device. This pin must be terminated.
FB	3	4	IN	Feedback pin for the internal regulation loop. Connect the external resistor divider to this pin. In case of fixed output voltage option, connect this pin directly to the output capacitor
GND	6	2	PWR	GND supply pin.
MODE	2	—	IN	This pin is only available at WSON package option. MODE pin = High forces the device to operate in fixed frequency PWM mode. MODE pin = Low enables the power save mode with automatic transition from PFM mode to fixed frequency PWM mode.
SW	1	5	OUT	This is the switch pin and is connected to the internal MOSFET switches. Connect the external inductor between this terminal and the output capacitor.
VIN	5	1	PWR	V <sub>IN</sub> power supply pin.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MAX	MIN	UNIT
V <sub>IN</sub>	Input voltage <sup>(2)</sup>	-0.3	7	V
	Voltage at EN, MODE	-0.3	V <sub>IN</sub> + 0.3 ≤ 7	
	Voltage on SW	-0.3	7	
	Peak output current	Internally limited		A
T <sub>J</sub>	Maximum operating junction temperature	-40	125	°C
T <sub>stg</sub>	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.

### 7.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge		
	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±2000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±1000	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V <sub>IN</sub>	Supply voltage	2		6	V
	Output voltage range for adjustable voltage	0.6		V <sub>IN</sub>	V
T <sub>A</sub>	Operating ambient temperature	-40		85	°C
T <sub>J</sub>	Operating junction temperature	-40		125	°C

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS62260, TPS62261, TPS62262, TPS62263	TPS62260, TPS62262	UNIT
		DRV [WSON]	DDC [SOT]	
		6 PINS	5 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	67.8	226.9	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	88.5	40.7	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	37.2	48.8	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	2.0	0.5	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	37.6	48.1	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	7.9	n/a	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 7.5 Electrical Characteristics

Over full operating ambient temperature range, typical values are at  $T_A = 25^\circ\text{C}$ . Unless otherwise noted, specifications apply for condition  $V_{IN} = EN = 3.6\text{ V}$ . External components  $C_{IN} = 4.7\ \mu\text{F}$  0603,  $C_{OUT} = 10\ \mu\text{F}$  0603,  $L = 2.2\ \mu\text{H}$ , see the parameter measurement information.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>SUPPLY</b>						
$V_{IN}$	Input voltage range		2.3		6	V
$I_{OUT}$	Output current	$V_{IN} = 2.5\text{ V to }6\text{ V}$			600	mA
		$V_{IN} = 2.3\text{ V to }2.5\text{ V}$			300	
		$V_{IN} = 2\text{ V to }2.3\text{ V}$			150	
$I_Q$	Operating quiescent current	$I_{OUT} = 0\text{ mA}$ , PFM mode enabled (MODE = GND) device not switching		15		$\mu\text{A}$
		$I_{OUT} = 0\text{ mA}$ , PFM mode enabled (MODE = GND) device switching, $V_{OUT} = 1.8\text{ V}$ , see <sup>(1)</sup>		18.5		
		$I_{OUT} = 0\text{ mA}$ , switching with no load (MODE = $V_{IN}$ ), PWM operation, $V_{OUT} = 1.8\text{ V}$ , $V_{IN} = 3\text{ V}$		3.8		mA
$I_{SD}$	Shutdown current	EN = GND		0.1	1	$\mu\text{A}$
UVLO	Undervoltage lockout threshold	Falling		1.85		V
		Rising		1.95		
<b>ENABLE, MODE</b>

## 8 Detailed Description

### 8.1 Overview

The TPS6226x step-down converter operates with typically 2.25-MHz fixed frequency pulse-width modulation (PWM) at moderate to heavy load currents. At light load currents, the converter can automatically enter power save mode and operate in pulse-frequency modulation (PFM) mode.

During PWM operation, the converter uses a unique fast-response voltage mode control scheme with input voltage feed-forward to achieve good line and load regulation, allowing the use of small ceramic input and output capacitors. At the beginning of each clock cycle initiated by the clock signal, the high-side MOSFET switch is turned on. The current then flows from the input capacitor, through the high-side MOSFET switch, through the inductor, and to the output capacitor and load. During this phase, the current ramps up until the PWM comparator trips and the control logic turns off the switch. The current limit comparator also turns off the switch if the current limit of the high-side MOSFET switch is exceeded. After a dead time preventing shoot-through current, the low-side MOSFET rectifier is turned on and the inductor current ramps down. The current then flows from the inductor to the output capacitor and to the load. It returns back to the inductor through the low-side MOSFET rectifier.

The next cycle is initiated by the clock signal, turning off the low-side MOSFET rectifier and turning on the high-side MOSFET switch.

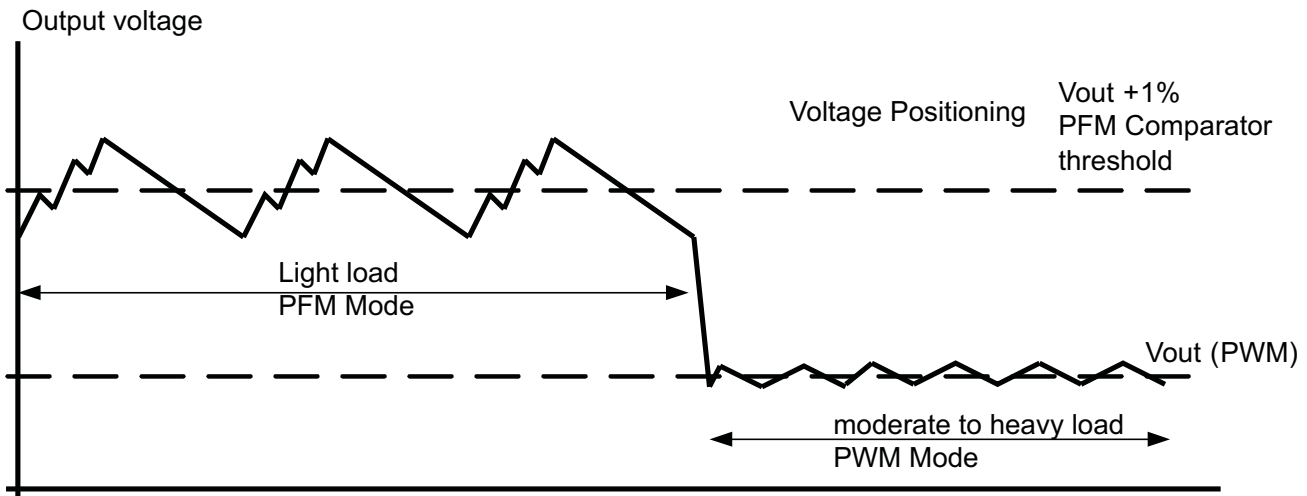

### 8.2 Functional Block Diagram

### 8.3 Feature Description

#### 8.3.1 Dynamic Voltage Positioning

This feature reduces the voltage undershoots/overshoots at load steps from light to heavy load and vice versa. It is active in power save mode and regulates the output voltage 1% higher than the nominal value. This provides more headroom for both the voltage drop at a load step, and the voltage increase at a load throw-off.

**Feature Description (continued)**

**Figure 5. Power Save Mode Operation With Automatic Mode Transition**
**8.3.2 Undervoltage Lockout**

The undervoltage lockout circuit prevents the device from malfunctioning at low input voltages and from excessive discharge of the battery and disables the output stage of the converter. The undervoltage lockout threshold is typically 1.85 V with falling  $V_{IN}$ .

**8.3.3 Mode Selection**

The MODE pin allows mode selection between forced PWM mode and power save mode.

Connecting this pin to GND enables the power save mode with automatic transition between PWM and PFM mode. Pulling the MODE pin high forces the converter to operate in fixed frequency PWM mode even at light load currents. This allows simple filtering of the switching frequency for noise sensitive applications. In this mode, the efficiency is lower compared to the power save mode during light loads.

The condition of the MODE pin can be changed during operation and allows efficient power management by adjusting the operation mode of the converter to the specific system requirements.

**8.3.4 Enable**

The device is enabled by setting the EN pin to high. During the start up time  $t_{Start Up}$  the internal circuits are settled and the soft start circuit is activated. The EN input can be used to control power sequencing in a system with various DC/DC converters. The EN pin can be connected to the output of another converter, to drive the EN pin high and getting a sequencing of supply rails. With EN = GND, the device enters shutdown mode in which all internal circuits are disabled. In fixed output voltage versions, the internal resistor divider network is then disconnected from FB pin.

**8.3.5 Thermal Shutdown**

As soon as the junction temperature,  $T_J$ , exceeds 140°C (typical) the device goes into thermal shutdown. In this mode, the high side and low side MOSFETs are turned off. The device continues its operation when the junction temperature falls below the thermal shutdown hysteresis.

## 8.4 Device Functional Modes

### 8.4.1 Soft-Start

The TPS6226x has an internal soft start circuit that controls the ramp up of the output voltage. The output voltage ramps up from 5% to 95% of its nominal value within typical 250  $\mu$ s. This limits the inrush current in the converter during ramp up and prevents possible input voltage drops when a battery or high impedance power source is used. The soft start circuit is enabled within the start up time  $t_{Start\ Up}$ .

### 8.4.2 Power Save Mode

The power save mode is enabled with MODE pin set to low level. If the load current decreases, the converter will enter power save mode operation automatically. During power save mode the converter skips switching and operates with reduced frequency in PFM mode with a minimum quiescent current to maintain high efficiency. The converter will position the output voltage typically +1% above the nominal output voltage. This voltage positioning feature minimizes voltage drops caused by a sudden load step.

The transition from PWM mode to PFM mode occurs once the inductor current in the low side MOSFET switch becomes zero, which indicates discontinuous conduction mode.

During the power save mode the output voltage is monitored with a PFM comparator. As the output voltage falls below the PFM comparator threshold of  $V_{OUT}$  nominal +1%, the device starts a PFM current pulse. The high side MOSFET switch will turn on, and the inductor current ramps up. After the on-time expires, the switch is turned off and the low side MOSFET switch is turned on until the inductor current becomes zero.

The converter effectively delivers a current to the output capacitor and the load. If the load is below the delivered current, the output voltage will rise. If the output voltage is equal to or higher than the PFM comparator threshold, the device stops switching and enters a sleep mode with typical 15- $\mu$ A current consumption.

If the output voltage is still below the PFM comparator threshold, a sequence of further PFM current pulses are generated until the PFM comparator threshold is reached. The converter starts switching again once the output voltage drops below the PFM comparator threshold.

With a fast single threshold comparator, the output voltage ripple during PFM mode operation can be kept small. The PFM pulse is time controlled, which allows to modify the charge transferred to the output capacitor by the value of the inductor. The resulting PFM output voltage ripple and PFM frequency depend in first order on the size of the output capacitor and the inductor value. Increasing output capacitor values and inductor values will minimize the output ripple. The PFM frequency decreases with smaller inductor values and increases with larger values.

The PFM mode is left and PWM mode entered in case the output current can not longer be supported in PFM mode. The power save mode can be disabled through the MODE pin set to high. The converter will then operate in fixed frequency PWM mode.

### 8.4.3 100% Duty Cycle Low Dropout Operation

The device starts to enter 100% duty cycle mode once the input voltage comes close to the nominal output voltage. In order to maintain the output voltage, the high side MOSFET switch is turned on 100% for one or more cycles.

With further decreasing  $V_{IN}$  the high side MOSFET switch is turned on completely. In this case the converter offers a low input-to-output voltage difference. This is particularly useful in battery-powered applications to achieve longest operation time by taking full advantage of the whole battery voltage range.

The minimum input voltage to maintain regulation depends on the load current and output voltage, and can be calculated as:

$$V_{INmin} = V_{OUTmax} + I_{OUTmax} \times (R_{DS(on)}max + R_L)$$

where

- $I_{OUTmax}$  = Maximum output current plus inductor ripple current
  - $R_{DS(on)}max$  = Maximum P-channel switch  $R_{DS(on)}$
  - $R_L$  = DC resistance of the inductor
  - $V_{OUTmax}$  = Nominal output voltage plus maximum output voltage tolerance
- (1)

## Device Functional Modes (continued)

### 8.4.4 Short-Circuit Protection

The high side and low side MOSFET switches are short-circuit protected with maximum switch current equal to  $I_{LIMF}$ . The current in the switches is monitored by current limit comparators. Once the current in the high side MOSFET switch exceeds the threshold of its current limit comparator, it turns off and the low side MOSFET switch is activated to ramp down the current in the inductor and high side MOSFET switch. The high side MOSFET switch can only turn on again, once the current in the low side MOSFET switch has decreased below the threshold of its current limit comparator.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The TPS6226x device is a high-efficiency synchronous step-down DC/DC converter featuring power save mode or 2.25 MHz fixed frequency operation.

### 9.2 Typical Application

**Figure 6. TPS62260DRV Adjustable 1.2-V Output**

#### 9.2.1 Design Requirements

The device operates over an input voltage range from 2 V to 6 V. The output voltage is adjustable using an external feedback divider.

#### 9.2.2 Detailed Design Procedure

**Table 1. List of Components**

COMPONENT REFERENCE	PART NUMBER	MANUFACTURER	VALUE
C <sub>IN</sub>	GRM188R60J475K	Murata	4.7 µF, 6.3 V. X5R Ceramic
C <sub>OUT</sub>	GRM188R60J106M	Murata	10 µF, 6.3 V. X5R Ceramic
C <sub>1</sub>		Murata	22 pF, COG Ceramic
L <sub>1</sub>	LPS3015	Coilcraft	2.2 µH, 110 mΩ
R <sub>1</sub> , R <sub>2</sub>	Values depending on the programmed output voltage		

##### 9.2.2.1 Output Voltage Setting

The output voltage can be calculated to:

$$V_{OUT} = V_{REF} \times \left( 1 + \frac{R_1}{R_2} \right) \text{ with an internal reference voltage } V_{REF} \text{ typical } 0.6 \text{ V.}$$

To minimize the current through the feedback divider network, R<sub>2</sub> should be 180 kΩ or 360 kΩ. The sum of R<sub>1</sub> and R<sub>2</sub> should not exceed ~1 MΩ, to keep the network robust against noise.

An external feed forward capacitor C<sub>1</sub> is required for optimum load transient response. The value of C<sub>1</sub> should be in the range between 22 pF and 33 pF.

Route the FB line away from noise sources, such as the inductor or the SW line.

### 9.2.2.2 Output Filter Design (Inductor and Output Capacitor)

The TPS6226x is designed to operate with inductors in the range of 1.5  $\mu\text{H}$  to 4.7  $\mu\text{H}$  and with output capacitors in the range of 4.7  $\mu\text{F}$  to 22  $\mu\text{F}$ . The part is optimized for operation with a 2.2- $\mu\text{H}$  inductor and 10- $\mu\text{F}$  output capacitor.

Larger or smaller inductor values can be used to optimize the performance of the device for specific operation conditions. For stable operation, the L and C values of the output filter may not fall below 1- $\mu\text{H}$  effective inductance and 3.5- $\mu\text{F}$  effective capacitance.

Selecting larger capacitors is less critical because the corner frequency of the L-C filter moves to lower frequencies with fewer stability problems.

#### 9.2.2.2.1 Inductor Selection

The inductor value has a direct effect on the ripple current. The selected inductor has to be rated for its DC resistance and saturation current. The inductor ripple current ( $\Delta I_L$ ) decreases with higher inductance and increases with higher  $V_{IN}$  or  $V_{OUT}$ .

The inductor selection also has an impact on the output voltage ripple in the PFM mode. Higher inductor values will lead to lower output voltage ripple and higher PFM frequency, lower inductor values will lead to a higher output voltage ripple but lower PFM frequency.

[Equation 2](#) calculates the maximum inductor current in PWM mode under static load conditions. The saturation current of the inductor should be rated higher than the maximum inductor current as calculated with [Equation 3](#). This is recommended because during heavy load transient the inductor current will rise above the calculated value.

$$\Delta I_L = V_{OUT} \times \frac{1 - \frac{V_{OUT}}{V_{IN}}}{L \times f}$$

where

- f = Switching frequency (2.25-MHz typical)
- L = Inductor value
- $\Delta I_L$  = Peak-to-peak inductor ripple current

(2)

$$I_L \text{ max} = I_{OUT} \text{ max} + \frac{\Delta I_L}{2}$$

where

- $\Delta I_L$  = Peak-to-peak inductor ripple current
- $I_{L\text{max}}$  = Maximum inductor current

(3)

A more conservative approach is to select the inductor current rating just for the maximum switch current limit  $I_{LIMF}$  of the converter.

Accepting larger values of ripple current allows the use of lower inductance values, but results in higher output voltage ripple, greater core losses, and lower output current capability.

The total losses of the coil have a strong impact on the efficiency of the DC/DC conversion and consist of both the losses in the dc resistance ( $R_{(DC)}$ ) and the following frequency-dependent components:

- The losses in the core material (magnetic hysteresis loss, especially at high switching frequencies)
- Additional losses in the conductor from the skin effect (current displacement at high frequencies)
- Magnetic field losses of the neighboring windings (proximity effect)
- Radiation losses

**Table 2. List of Inductors**

DIMENSIONS [mm <sup>3</sup> ]	Inductance $\mu\text{H}$	INDUCTOR TYPE	SUPPLIER
2.5 x 2.0 x 1.0 max	2.0	MIPS2520D2R2	FDK
2.5 x 2.0 x 1.2 max	2.0	MIPSA2520D2R2	FDK
2.5 x 2.0 x 1.0 max	2.2	KSLI-252010AG2R2	Htachi Metals
2.5 x 2.0 x 1.2 max	2.2	LQM2HPN2R2MJ0L	Murata
3 x 3 x 1.5 max	2.2	LPS3015 2R2	Coilcraft

### 9.2.2.2.2 Output Capacitor Selection

The advanced fast-response voltage mode control scheme of the TPS6226x allows the use of tiny ceramic capacitors. Ceramic capacitors with low ESR values have the lowest output voltage ripple and are recommended. The output capacitor requires either an X7R or X5R dielectric. Y5V and Z5U dielectric capacitors, aside from their wide variation in capacitance over temperature, become resistive at high frequencies.

At nominal load current, the device operates in PWM mode and the RMS ripple current is calculated as:

$$I_{\text{RMS}C_{\text{OUT}}} = V_{\text{OUT}} \times \frac{1 - \frac{V_{\text{OUT}}}{V_{\text{IN}}}}{L \times f} \times \frac{1}{2 \times \sqrt{3}} \quad (4)$$

At nominal load current, the device operates in PWM mode and the overall output voltage ripple is the sum of the voltage spike caused by the output capacitor ESR plus the voltage ripple caused by charging and discharging the output capacitor:

$$\Delta V_{\text{OUT}} = V_{\text{OUT}} \times \frac{1 - \frac{V_{\text{OUT}}}{V_{\text{IN}}}}{L \times f} \times \left( \frac{1}{8 \times C_{\text{OUT}} \times f} + \text{ESR} \right) \quad (5)$$

At light load currents, the converter operates in power save mode and the output voltage ripple is dependent on the output capacitor and inductor value. Larger output capacitor and inductor values minimize the voltage ripple in PFM mode and tighten DC output accuracy in PFM mode.

### 9.2.2.2.3 Input Capacitor Selection

An input capacitor is required for best input voltage filtering, and minimizing the interference with other circuits caused by high input voltage spikes. For most applications, a 4.7- $\mu\text{F}$  to 10- $\mu\text{F}$  ceramic capacitor is recommended. Because ceramic capacitor loses up to 80% of its initial capacitance at 5 V, it is recommended that 10- $\mu\text{F}$  input capacitors be used for input voltages >4.5 V. The input capacitor can be increased without any limit for better input voltage filtering. Take care when using only small ceramic input capacitors. When a ceramic capacitor is used at the input and the power is being supplied through long wires, such as from a wall adapter, a load step at the output or  $V_{\text{IN}}$  step on the input can induce ringing at the  $V_{\text{IN}}$  pin. This ringing can couple to the output and be mistaken as loop instability or could even damage the part by exceeding the maximum ratings.

**Table 3. List of Capacitors**

CAPACITANCE	TYPE	SIZE	SUPPLIER
4.7 $\mu\text{F}$	GRM188R60J475K	0603 1.6 x 0.8 x 0.8 mm <sup>3</sup>	Murata
10 $\mu\text{F}$	GRM188R60J106M69D	0603 1.6 x 0.8 x 0.8 mm <sup>3</sup>	Murata

Table 1 shows the list of components for the [Application Curves](#).

#### 9.3.3 TPS62261, Fixed 1.8-V Output

Figure 37. TPS62261 Fixed 1.8-V Output

## 10 Power Supply Recommendations

The TPS6226x device has no special requirements for its input power supply. The input power supply output current must be rated according to the supply voltage, output voltage, and output current of the TPS6226x.

## 11 Layout

### 11.1 Layout Guidelines

As for all switching power supplies, the layout is an important step in the design. Proper function of the device demands careful attention to PCB layout. Care must be taken in board layout to get the specified performance. If the layout is not carefully done, the regulator could show poor line and/or load regulation, and additional stability issues as well as EMI problems. It is critical to provide a low inductance, impedance ground path. Therefore, use wide and short traces for the main current paths. The input capacitor should be placed as close as possible to the IC pins as well as the inductor and output capacitor.

Connect the GND pin of the device to the PowerPAD™ land of the PCB and use this pad as a star point. Use a common power GND node and a different node for the signal GND to minimize the effects of ground noise. Connect these ground nodes together to the PowerPAD land (star point) underneath the IC. Keep the common path to the GND pin, which returns the small signal components and the high current of the output capacitors as short as possible to avoid ground noise. The FB line should be connected right to the output capacitor and routed away from noisy components and traces (for example, the SW line).

### 11.2 Layout Examples

**Figure 38. Suggested Layout for Fixed Output Voltage Options**

Layout Examples (continued)

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
