## DRV5021 Low-Voltage, Unipolar, Digital-Switch Hall Effect Sensor

## 1 Features

- Digital Unipolar-Switch Hall Sensor
- 2.5-V to $5.5-\mathrm{V}$ Operating $\mathrm{V}_{\mathrm{CC}}$ Range
- Magnetic Sensitivity Options ( $\mathrm{B}_{\mathrm{OP}}, \mathrm{B}_{\mathrm{RP}}$ ):
- DRV5021A1: $2.9 \mathrm{mT}, 1.8 \mathrm{mT}$
- DRV5021A2: $9.2 \mathrm{mT}, 7.0 \mathrm{mT}$
- DRV5021A3: $17.9 \mathrm{mT}, 14.1 \mathrm{mT}$
- Fast $30-\mathrm{kHz}$ Sensing Bandwidth
- Open-Drain Output Capable of 20 mA
- Optimized Low-Voltage Architecture
- Integrated Hysteresis to Enhance Noise Immunity
- Operating Temperature Range: $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$
- Standard Industry Package:
- Surface-Mount SOT-23

## 2 Applications

- Home Appliances
- Industrial Valves, Solenoids
- Limit Switches
- General Proximity Sensing
- Brushed DC Motor Feedback
- Docking Detection
- Door Open and Close Detection
- Pulse Counting

## 3 Description

The DRV5021 device is a low-voltage, digital-switch, Hall effect sensor for high-speed applications. Operating from a $2.5-\mathrm{V}$ to $5.5-\mathrm{V}$ power supply, the device senses magnetic flux density, and gives a digital output based on predefined magnetic thresholds.

This device senses magnetic fields perpendicular to the face of the package. When the applied magnetic flux density exceeds the magnetic operate point ( $\mathrm{B}_{\mathrm{OP}}$ ) threshold, the open-drain output of the device drives a low voltage. When the flux density decreases to less than the magnetic release point ( $\mathrm{B}_{\mathrm{RP}}$ ) threshold, the output goes to high impedance. The hysteresis resulting from the separation of $\mathrm{B}_{\mathrm{OP}}$ and $\mathrm{B}_{\mathrm{RP}}$ helps prevent output errors caused by input noise. This configuration makes system designs more robust against noise interference.
The device operates consistently across a wide ambient temperature range of $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$.

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

| DATE | REVISION | NOTES |
| :---: | :---: | :---: |
| December 2018 | $*$ | Initial release. |

## 5 Pin Configuration and Functions

Pin Functions

| PIN |  | TYPE |  |
| :--- | :---: | :---: | :--- |
| NAME | DBZ |  |  |
| GND | 3 | GND | Ground pin |
| OUT | 2 | Output | Hall sensor open-drain output. The open drain requires a pullup resistor. |
| $V_{C C}$ | 1 | Power | 2.5-V to $5.5-\mathrm{V}$ power supply. Bypass this pin to the GND pin with a $0.1-\mu \mathrm{F}$ (minimum) ceramic <br> capacitor rated for $\mathrm{V}_{C C}$. |

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ${ }^{(1)}$

|  | MIN | MAX | UNIT |
| :--- | ---: | ---: | :---: |
| Power supply voltage (VCC) | -0.3 | 6.0 | V |
| Output voltage (OUT) | -0.3 | 6.0 | V |
| Output current (OUT) |  | 30 | mA |
| Magnetic flux density, $\mathrm{B}_{\text {MAX }}$ |  | Unlimited | T |
| Operating junction temperature, $\mathrm{T}_{\mathrm{J}}$ | -40 | 140 | ${ }^{\circ} \mathrm{C}$ |
| Storage temperature, $\mathrm{T}_{\text {stg }}$ | -65 | 150 | ${ }^{\circ} \mathrm{C}$ |

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

over operating free-air temperature range (unless otherwise noted)

|  |  |  | VALUE | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {(ESD) }}$ | Electrostatic discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ${ }^{(1)}$ | $\pm 4000$ | V |
|  |  | Charged device model (CDM), per JEDEC specification JESD22-C101 ${ }^{(2)}$ | $\pm 1000$ | V |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

Figure 9. Supply Current vs Temperature

## 7 Detailed Description

### 7.1 Overview

The DRV5021 device is a spinning-current Hall sensor with a digital output for magnetic-sensing applications. The DRV5021 can be powered with a supply voltage between 2.5 V and 5.5 V .
The field polarity is defined as follows: a south pole near the marked side of the package is a positive magnetic field. A north pole near the marked side of the package is a negative magnetic field. The output state depends on the magnetic field perpendicular to the package.
A strong south pole near the marked side of the package causes the output to pull low. A weak south pole, the absence of a field, or any north pole makes the output high impedance. Hysteresis is included in between the operate point and the release point to prevent toggling near the magnetic threshold.

An external pullup resistor is required on the OUT pin. The OUT pin can be pulled up to $\mathrm{V}_{\mathrm{CC}}$, or to a different voltage supply. This feature allows for easier interfacing with controller circuits.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

### 7.3.1 Field Direction Definition

As shown in Figure 10, the DRV5021 is sensitive to the magnetic field component that is perpendicular to the top of the package.

Figure 10. Direction of Sensitivity

## Feature Description (continued)

Figure 11 shows that a positive magnetic field is defined as a south pole near the marked side of the package.

Figure 11. Field Direction Definition

### 7.3.2 Device Output

If the device is powered on with a magnetic field strength between $B_{R P}$ and $B_{O P}$, then the device output is indeterminate. If the field strength is greater than $\mathrm{B}_{\mathrm{OP}}$, then the output is pulled low. If the field strength is less than $B_{R P}$, then the output is released.

Figure 12. Output State

## Feature Description (continued)

### 7.3.3 Power-On Time

After applying $\mathrm{V}_{\mathrm{CC}}$ to the DRV5021, $\mathrm{t}_{\text {on }}$ must elapse before the OUT pin is valid. In case 1 (Figure 13) and case 2 (Figure 14), the output is defined assuming that magnetic field $B_{A P P L I E D}>B_{O P}$, and $B_{A P P L I E D}<B_{\text {RPP }}$, respectively.

Figure 13. Case 1: Power On When $B>B_{o p}$

Figure 14. Case 2: Power On When $B<B_{R P}$

## Feature Description (continued)

If the device is powered on with $\mathrm{B}_{\text {RP }}<\mathrm{B}_{\text {APPLIED }}<\mathrm{B}_{\mathrm{OP}}$, then the device output remains in indeterminate state until the magnetic field changes. After the change in magnetic field results in a condition that meets either $\mathrm{B}_{\mathrm{OP}}<$ $B_{\text {APPLIED }}$ or $B_{\text {RPP }}>B_{\text {APPLIED }}$, the output turns to valid state after $t_{d}$ time elapses. Case 3 (Figure 15) and case 4 (Figure 16) show examples of this behavior.

Figure 15. Case 3: Power On When $B_{R P}<B<B_{O P}$, Followed by $B>B_{O P}$

Figure 16. Case 4: Power On When $B_{R P}<B<B_{O P}$, Followed by $B<B_{R P}$

## Feature Description (continued)

### 7.3.4 Hall Element Location

The sensing element inside the device is in the center of both packages when viewed from the top. Figure 17 shows the tolerances and side-view dimensions.

Figure 17. Hall Element Location

## Feature Description (continued)

### 7.3.5 Propagation Delay

The DRV5021 samples the Hall element at a nominal sampling period of $16.67 \mu$ s to detect the presence of a magnetic north or south pole. At each sampling point, the device takes the average of the current sampled value and immediately preceding sampled value of the magnetic field. If this average value crosses the $\mathrm{B}_{\mathrm{OP}}$ or $\mathrm{B}_{\mathrm{RP}}$ threshold, the device output changes according to the transfer function.
Figure 18 shows the DRV5021 propagation delay analysis in the proximity of a magnetic south pole. The Hall element of the DRV5021 experiences an increasing magnetic field as the magnetic south pole approaches near the device. At time $t_{2}$, the average magnetic field is $\left(B_{2}+B_{1}\right) / 2$, which is less than the $B_{o p}$ threshold of the device. At time $t_{3}$, the actual magnetic field has crossed the $B_{\text {op }}$ threshold. However, the average $\left(B_{3}+B_{2}\right) / 2$ is still less than the $B_{0 p}$ threshold. Thus, the device waits for next sample time, $\mathrm{t}_{4}$, to start the output transition through the analog signal chain. The propagation delay, $\mathrm{t}_{\mathrm{d}}$, is measured as the delay from the time the magnetic field crosses the $\mathrm{B}_{\mathrm{OP}}$ threshold to the time output transitions.

Figure 18. Propagation Delay

## Feature Description (continued)

### 7.3.6 Output Stage

The DRV5021 output stage uses an open-drain NMOS transistor that is rated to sink up to 20 mA of current. For proper operation, calculate the value of pullup resistor R1 using Equation 1.

$$
\begin{equation*}
\frac{V_{\text {ref }} \max }{20 \mathrm{~mA}} \leq R 1 \leq \frac{V_{\text {ref }} \min }{100 \mu \mathrm{~A}} \tag{1}
\end{equation*}
$$

The size of R1 is a tradeoff between the OUT rise time and the current when OUT is pulled low. A lower current is generally better; however, faster transitions and bandwidth require a smaller resistor for faster switching.
In addition, the value of R1 must be $>500 \Omega$ in order to make sure that the output driver can pull the OUT pin close to GND.

## NOTE

$\mathrm{V}_{\text {ref }}$ is not restricted to $\mathrm{V}_{\mathrm{Cc}}$. The allowable voltage range of this pin is specified in the Recommended Operating Conditions.

Figure 19. Open-Drain Output
Select a value for C 2 based on the system bandwidth specifications shown in Equation 2.

$$
\begin{equation*}
2 \times f_{\mathrm{BW}}(\mathrm{~Hz})<\frac{1}{2 \pi \times \mathrm{R} 1 \times \mathrm{C} 2} \tag{2}
\end{equation*}
$$

Most applications do not require this C2 filtering capacitor.

### 7.4 Device Functional Modes

The DRV5021 device is active only when $\mathrm{V}_{\mathrm{CC}}$ is between 2.5 V and 5.5 V .

## 8 Application and Implementation

## NOTE

Information in the following applications sections is not part of the Tl component specification, and Tl does not warrant its accuracy or completeness. Tl's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The DRV5021 device is used in magnetic-field sensing applications.

### 8.2 Typical Applications

### 8.2.1 Proximity Sensing Circuit

Figure 20. Proximity Sensing Circuit

### 8.2.1.1 Design Requirements

For this design example, use the parameters listed in Table 1 as the input parameters.
Table 1. Design Parameters

| DESIGN PARAMETER | REFERENCE | EXAMPLE VALUE |
| :--- | :---: | :---: |
| Supply voltage | $\mathrm{V}_{\mathrm{CC}}$ | 3.2 V to 3.4 V |
| System bandwidth | $f_{\mathrm{BW}}$ | 10 kHz |

### 8.2.1.2 Detailed Design Procedure

Table 2 shows the external components needed to create this design example.
Table 2. External Components

| COMPONENT | CONNECTED BETWEEN | RECOMMENDED |  |
| :---: | :---: | :---: | :--- |
| C 1 | $\mathrm{~V}_{\mathrm{CC}}$ | GND | A $0.1-\mu \mathrm{F}$ ceramic capacitor rated for $\mathrm{V}_{\mathrm{CC}}$ |
| C 2 | OUT | GND | Optional: Place a ceramic capacitor to GND |
| R 1 | OUT | $\mathrm{V}_{\mathrm{CC}}{ }^{(1)}$ | Requires a pullup resistor |

(1) Pullup resistor may be connected to a voltage source other than $\mathrm{V}_{\mathrm{Cc}}$; see the Recommended Operating Conditions for the valid range of the output pin voltage.

### 8.2.1.2.1 Configuration Example

In a 3.3-V system, $3.2 \mathrm{~V} \leq \mathrm{V}_{\text {ref }} \leq 3.4 \mathrm{~V}$. Use Equation 3 to calculate the allowable range for R 1 .

$$
\begin{equation*}
\frac{\mathrm{V}_{\mathrm{ref}} \mathrm{max}}{20 \mathrm{~mA}} \leq \mathrm{R} 1 \leq \frac{\mathrm{V}_{\mathrm{ref}} \mathrm{~min}}{100 \mu \mathrm{~A}} \tag{3}
\end{equation*}
$$

For this design example, use Equation 4 to calculate the allowable range of R1.

$$
\begin{equation*}
\frac{3.4 \mathrm{~V}}{20 \mathrm{~mA}} \leq \mathrm{R} 1 \leq \frac{3.2 \mathrm{~V}}{100 \mu \mathrm{~A}} \tag{4}
\end{equation*}
$$

Therefore:
$170 \Omega \leq R 1 \leq 32 \mathrm{k} \Omega$
After finding the allowable range of R1 (Equation 5), select a value between $500 \Omega$ and $32 \mathrm{k} \Omega$ for R1.
Assuming a system bandwidth of 10 kHz , use Equation 6 to calculate the value of C 2 .

$$
\begin{equation*}
2 \times f_{\mathrm{BW}}(\mathrm{~Hz})<\frac{1}{2 \pi \times \mathrm{R} 1 \times \mathrm{C} 2} \tag{6}
\end{equation*}
$$

For this design example, use Equation 7 to calculate the value of C 2 .

$$
\begin{equation*}
2 \times 10 \mathrm{kHz}<\frac{1}{2 \pi \times \mathrm{R} 1 \times \mathrm{C} 2} \tag{7}
\end{equation*}
$$

An R1 value of $10 \mathrm{k} \Omega$ and a C 2 value less than 820 pF satisfy the requirement for a $10-\mathrm{kHz}$ system bandwidth.
For R1 $=10 \mathrm{k} \Omega$ and $\mathrm{C} 2=680 \mathrm{pF}$, the corner frequency for the low-pass filter is 23.4 kHz .

### 8.2.1.3 Application Curves

Figure 23. Low-Pass Filtering

### 8.2.2 Alternative Two-Wire Application

For systems that require a minimal wire count, connect the device output to $\mathrm{V}_{C C}$ through a resistor, and sense the total supplied current near the controller. Use a shunt resistor or other circuitry to sense the current.

Figure 24. 2-Wire Application

### 8.2.2.1 Design Requirements

Table 3 lists the related design parameters.
Table 3. Design Parameters

| DESIGN PARAMETER | REFERENCE | EXAMPLE VALUE |
| :--- | :---: | :---: |
| Supply voltage | $\mathrm{V}_{\mathrm{CC}}$ | 5 V |
| OUT resistor | R 1 | $1 \mathrm{k} \Omega$ |
| Bypass capacitor | C 1 | $0.1 \mu \mathrm{~F}$ |
| Current when B < $\mathrm{B}_{\text {RP }}$ | $\mathrm{I}_{\text {RELEASE }}$ | About 2.3 mA |
| Current when B > $\mathrm{B}_{\mathrm{OP}}$ | $\mathrm{I}_{\text {OPERATE }}$ | About 7.3 mA |

### 8.2.2.2 Detailed Design Procedure

When the open-drain output of the device is high-impedance, current through the path equals the $\mathrm{I}_{\mathrm{CC}}$ of the device (approximately 2.3 mA ).

When the output pulls low, a parallel current path is added, equal to $\mathrm{V}_{\mathrm{CC}} /\left(\mathrm{R} 1+\mathrm{r}_{\mathrm{DS}(\mathrm{on})}\right)$. Using 5 V and $1 \mathrm{k} \Omega$, the parallel current is approximately 5 mA , making the total current approximately 7.3 mA .
Local bypass capacitor C 1 must be at least $0.1 \mu \mathrm{~F}$. Use a larger value capacitor if there is high inductance in the power line interconnect.

## 9 Power Supply Recommendations

The DRV5021 device is designed to operate from an input voltage supply (VM) range between 2.5 V and 5.5 V . A $0.1-\mu \mathrm{F}$ (minimum) ceramic capacitor rated for $\mathrm{V}_{\mathrm{CC}}$ must be placed as close to the DRV5021 device as possible.

## 10 Layout

### 10.1 Layout Guidelines

Place the bypass capacitor near the DRV5021 device for efficient power delivery with minimal inductance. Place the external pullup resistor near the microcontroller input to provide the most stable voltage at the input. Alternatively, an integrated pullup resistor within the GPIO of the microcontroller can be used.

Generally, PCB copper planes underneath the DRV5021 have no effect on magnetic flux, and do not interfere with device performance because copper is not a ferromagnetic material. However, If nearby system components contain iron or nickel, they may redirect magnetic flux in unpredictable ways.

### 10.2 Layout Example

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

### 11.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.
ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 11.6 Glossary

SLYZ022 - TI Glossary.
This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the $<=1000$ ppm threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a " $\sim$ " will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents Tl's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

OTHER QUALIFIED VERSIONS OF DRV5021 :

- Automotive: DRV5021-Q1

NOTE: Qualified Version Definitions:

- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Reference JEDEC registration TO-236, except minimum foot length.
4. Support pin may differ or may not be present.

SOLDER MASK DETAILS

NOTES: (continued)
4. Publication IPC-7351 may have alternate designs.
5. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE
BASED ON 0.125 THICK STENCIL SCALE:15X

NOTES: (continued)
6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
7. Board assembly site may have different recommendations for stencil design.

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.
These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.
These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other Tl intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

Tl's products are provided subject to Tl's Terms of Sale or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter Tl's applicable warranties or warranty disclaimers for TI products.
TI objects to and rejects any additional or different terms you may have proposed.
