ACPL-071L and ACPL-074L

Single-Channel and Dual-Channel High-Speed 15-MBd CMOS Optocoupler

Description

The Broadcom® ACPL-071L (single-channel) and ACPL-074L (dual-channel) are 15-MBd CMOS optocouplers in SOIC-8 package. The optocouplers use the latest CMOS IC technology to achieve outstanding performance with very low power consumption. Basic building blocks of ACPL-071L and ACPL-074L are high speed LEDs and CMOS detector ICs. Each detector incorporates an integrated photodiode, a high-speed transimpedance amplifier, and a voltage comparator with an output driver.

Applications

- Digital field bus isolation:
- CANBus, RS485, USB
- Multiplexed data transmission
- Computer peripheral interface
- Microprocessor system interface
- DC/DC converter

Features

- +3.3V and +5 V CMOS compatibility
- 30 ns max. pulse width distortion
- 40 ns max. propagation delay (3.3V supply voltage)
- 30 ns max. propagation delay skew
- High speed: 15 MBd min.
- 10 kV/µs minimum common mode rejection
- –40°C to 105°C temperature range
- Safety and regulatory approvals:
  - UL recognized: 3750 V rms for 1 min. per UL 1577
  - CSA component acceptance Notice #5
  - IEC/EN/DIN EN 60747-5-5

CAUTION! It is advised that normal static precautions be taken in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD. The components featured in this data sheet are not to be used in military or aerospace applications or environments.

a. t_{PHL} propagation delay is measured from the 50% level on the rising edge of the input pulse to the 50% level of the falling edge of the V_O signal. t_{PLH} propagation delay is measured from the 50% level on the falling edge of the input pulse to the 50% level of the rising edge of the V_O signal.

b. PWD is defined as $|t_{PHL} - t_{PLH}|$.

c. t_{PSK} is equal to the magnitude of the worst case difference in t_{PHL} and/or t_{PLH} that will be seen between units at any given temperature within the recommended operating conditions.

d. CM_H is the maximum tolerable rate of rise of the common mode voltage to assure that the output will remain in a high logic state.

e. CM_L is the maximum tolerable rate of fall of the common mode voltage to assure that the output will remain in a low logic state.

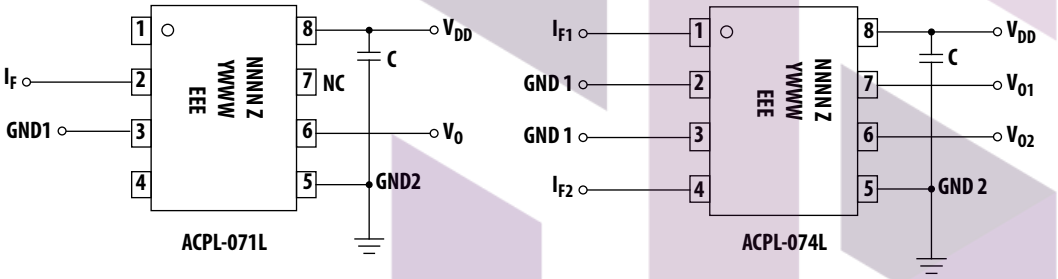
Application Information

Bypassing and PC Board Layout

The ACPL-071L and ACPL-074L optocouplers are extremely easy to use. ACPL-071L and ACPL-074L provide CMOS logic output due to the high-speed CMOS IC technology used.

The external components required for proper operation are the input limiting resistor and the output bypass capacitor. Capacitor should be placed as close as possible to the optocoupler and values should be between 0.01 µF and 0.1 µF.

Figure 8: Recommended Printed Circuit Board Layout



Powering Sequence

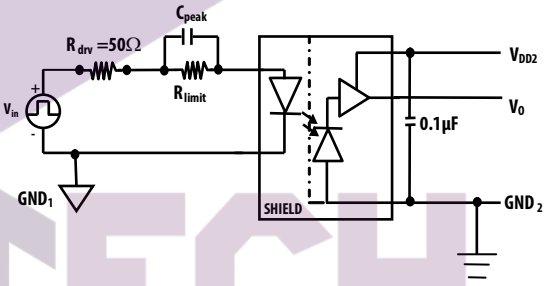
V_{DD} needs to achieve a minimum level of 3.0V before powering up the output connecting component.

Input Limiting Resistors

ACPL-071L and ACPL-074L are direct current driven (Figure 8), and thus eliminate the need for input power supply. To limit the amount of current flowing through the LED, it is recommended that a 210Ω resistor is connected in series with anode of LED (that is, Pin 2 for ACPL-071L and Pins 1 and 4 for ACPL-074L) at 5V input signal. At 3.3V input signal, it is recommended to connect a 80Ω resistor in series with anode of LED.

The recommended limiting resistors are based on the assumption that the driver output impedence is 50 (as shown in Figure 9).

Figure 9: Connection of Peaking capacitor (Cpeak) in Parallel of the Input Limiting Resistor (Rllimit) to Improve Speed Performance



Speed Improvement

A peaking capacitor can be placed across the input current limit resistor (Figure 9) to achieve enhanced speed performance. The value of the peaking cap is dependent to the rise and fall time of the input signal and supply voltages and LED input driving current (If). Figure 10 shows significant improvement of propagation delay and pulse with distortion with added peak capacitor at driving current of 14 mA and 3.3V or 5V power supply.
