

FEATURES

Low V_{OS} : 75 μ V Max
 Low V_{OS} Drift: 1.3 μ V/ $^{\circ}$ C Max
 Ultra-Stable vs. Time: 1.5 μ V/Month Max
 Low Noise: 0.6 μ V p-p Max
 Wide Input Voltage Range: \pm 14 V
 Wide Supply Voltage Range: 3 V to 18 V
 Fits 725,108A/308A, 741, AD510 Sockets
 125 $^{\circ}$ C Temperature-Tested Dice

APPLICATIONS

Wireless Base Station Control Circuits
 Optical Network Control Circuits
 Instrumentation
 Sensors and Controls
 Thermocouples
 RTDs
 Strain Bridges
 Shunt Current Measurements
 Precision Filters

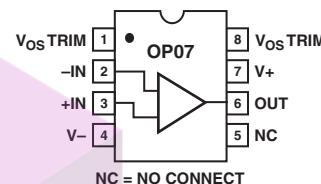

GENERAL DESCRIPTION

The OP07 has very low input offset voltage (75 μ V max for OP07E) which is obtained by trimming at the wafer stage. These low offset voltages generally eliminate any need for external nulling. The OP07 also features low input bias current (\pm 4 nA for OP07E) and high open-loop gain (200 V/mV for OP07E). The low offsets and high open-loop gain make the OP07 particularly useful for high-gain instrumentation applications.

The wide input voltage range of \pm 13 V minimum combined with high CMRR of 106 dB (OP07E) and high input impedance provides high accuracy in the noninverting circuit configuration. Excellent linearity and gain accuracy can be maintained even at

PIN CONNECTIONS

Epoxy Mini-Dip (P-Suffix)
8-Pin SO (S-Suffix)

high closed-loop gains. Stability of offsets and gain with time or variations in temperature is excellent. The accuracy and stability of the OP07, even at high gain, combined with the freedom from external nulling have made the OP07 an industry standard for instrumentation applications.

The OP07 is available in two standard performance grades. The OP07E is specified for operation over the 0 $^{\circ}$ C to 70 $^{\circ}$ C range, and OP07C over the -40 $^{\circ}$ C to +85 $^{\circ}$ C temperature range.

The OP07 is available in epoxy 8-lead Mini-DIP and 8-lead SOIC. It is a direct replacement for 725,108A, and OP05 amplifiers; 741-types may be directly replaced by removing the 741's nulling potentiometer. For improved specifications, see the OP177 or OP1177. For ceramic DIP and TO-99 packages and standard micro circuit (SMD) versions, see the OP77.

		$R_p = 20$ k Ω		± 4		mV

NOTES

¹Input offset voltage measurements are performed by automated test equipment approximately 0.5 seconds after application of power.

²Long-term input offset voltage stability refers to the averaged trend time of V_{OS} vs. Time over extended periods after the first 30 days of operation. Excluding the initial hour of operation, changes in V_{OS} during the first 30 operating days are typically 2.5 μV refer to the typical performance curves. Parameter is sample tested.

³Sample tested.

⁴Guaranteed by design.

⁵Guaranteed but not tested.

Specifications subject to change without notice.

ABSOLUTE MAXIMUM RATINGS*

Supply Voltage (V_s)	± 22 V
Input Voltage*	± 22 V
Differential Input Voltage	± 30 V
Output Short-Circuit Duration	Indefinite
Storage Temperature Range S, P Packages	-65°C to +125°C
Operating Temperature Range OP07E	0°C to 70°C
OP07C	-40°C to +85°C
Junction Temperature Range	150°C
Lead Temperature Range (Soldering, 60 sec)	300°C

*For supply voltages less than ± 22 V, the absolute maximum input voltage is equal to the supply voltage.

Package Type	θ_{JA}^*	θ_{JC}	Units
8-Lead Plastic DIP (P)	103	43	°C/W
8-Lead SOIC (S)	158	43	°C/W

* θ_{JA} is specified for worst case conditions, i.e., θ_{JA} is specified for device in socket for P-DIP package, θ_{JA} is specified for device soldered to printed circuit board for SO package.

ORDERING GUIDE

Model	Temperature Range	Package Description	Package Option	Branding Information
OP07EP	0°C to 70°C	8-Lead Epoxy DIP	P-8	
OP07CP	-40°C to 85°C	8-Lead Epoxy DIP	P-8	
OP07CS	-40°C to 85°C	8-Lead SOIC	S-8	

CAUTION

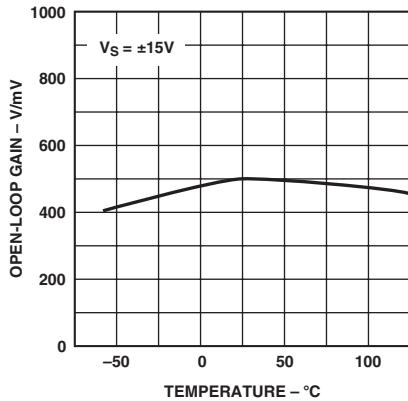

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the OP07 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high-energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

APPLICATIONS INFORMATION

OP07 series units may be substituted directly into 725, 108A/308A* and OP05 sockets with or without removal of external compensation or nulling components. Additionally, the OP07 may be used in unnullled 741 type sockets. However, if conventional 741 nulling circuitry is in use, it should be modified or removed to enable proper OP07 operation. OP07 offset voltage may be nulled to zero through use of a potentiometer (see offset nulling circuit diagram).

PRECISION ABSOLUTE-VALUE CIRCUIT

The OP07 provides stable operation with load capacitance of up to 500 pF and ± 10 V swings; larger capacitances should be decoupled with a 50 Ω decoupling resistor.

Stray thermoelectric voltages generated by dissimilar metals at the contacts to the input terminals can degrade drift performance. Therefore, best operation will be obtained when both input contacts are maintained at the same temperature, preferably close to the package temperature.

*TO-99 Package only
